Insect Control Tips

- 🐛 Attempt to eliminate unnecessary competing food sources and breeding sites. Fruit flies constantly look for food and places to breed. Keep problem areas clean by removing spoilage. Natural Catch® Plus traps are very effective in concert with good sanitation practices.
- 🐛 Consider the use of multiple traps in large areas.
- 🐛 Mark the date the trap is activated on the trap label. We recommend replacement after 30 days of use for maximum effectiveness.
- 🐛 Periodically inspect the trap. Make sure the trap entrance is clean and free of debris that would prevent flies from entering.
- 🐛 Use only the supplied poker to pierce the trap entrance. Too large a hole by other implement may allow flies to escape after entering the trap. Too small a hole will prevent flies to enter at all.
- 🐛 If you are still having problems after applying these tips, please contact us for technical assistance.
